WORK EXPERIENCE

Micron Technology, Inc.

2026/07 - 2026/08

Test Solution Engineer Intern, TSE-DRAM Probe Global Central Team

- Developed a large-scale wafer-test data pipeline (DuckDB + Parquet) for DRAM/HBM post-release monitoring and cross-revision comparison, automating nightly ingestion of yield, bin, and electrical-trend data.
- Automated cross-revision anomaly detection, shipped the backend API and orchestration layer serving results via a JFrog-backed cache to an engineering dashboard's data visualization and root-cause analysis.

Taichung Veterans General Hospital

2026/02 - present

Research Assistant

- Engineered an end-to-end deep learning pipeline transforming ECG time-series signals into multi-channel tensors via continuous wavelet transform, enabling robust classification with ResNet models in PyTorch.

EDUCATION

Master of Electrical Engineering, National Chung Hsing University

2025/06 - present

- Communication & Information Group - Wireless Communications and Networking Laboratory
- Course : Reinforcement Learning(A+), Embedded Real-Time Operating System for System-on-Chip(A+)

Bachelor of Communication Engineering, National Taipei University

2021/09 - 2025/06

- Senior Project : Incentive Design for Cooperative Cognitive Radio Networks
Research on incentive mechanism design for cooperative cognitive radio networks using game-theoretic approaches. Modeled the network interactions under a Stackelberg leadership framework to analyze cooperation between users. Proposed a novel incentive design that enhances user satisfaction without relying on monetary transactions.
- Course : Queueing Theory(A+), Operating Systems(A-), Data Structure, Game Theory Applications(A+), Multimedia Signal Processing (A-), Simulation and Emulation of Digital Communication Systems(A+), Signals and Systems

PROJECT

• **Optimal Resource Allocation in Container-Based Environments Using Genetic Algorithms**

Developed a container-based resource allocation simulation system for heterogeneous clusters, incorporating realistic cluster monitoring and microservice interaction modeling. Applied a multi-objective evolutionary algorithm (NSGA-II-based) to jointly optimize communication overhead and node resource utilization, outperforming the traditional greedy algorithm by 37% in overall efficiency.

• **Balloon Pop Bot: Embedded Vision-Guided Tracking Robot**

Developed an embedded robotics platform integrating ROS with a lightweight YOLOv8 model deployed on an edge device for real-time vision tracking and motion control. Designed and integrated a servo-driven balloon-popping mechanism for autonomous tracking and actuation.

SKILL

Programming Languages

C/C++, Python, JavaScript, Golang, SQL, Shell Script

Frameworks and Tools

Linux, ROS, Docker, K8s, Git, Grafana, DuckDB, REST API

CERTIFICATION

English Proficiency

TOEFL iBT - Overall 90 of 120, TOEIC Golden Certificate - 860

Professional License

Oracle Cloud Infrastructure 2025 Certified AI Foundations Associate
